ABSTRACT

Tests were conducted in the AEDC/VKF Tunnel B on an 0.010-scale model of the Space Shuttle Orbiter and External Tank to determine the aerodynamic interactions during a "Return to Launch Site" (RTLS) abort separation. The Orbiter model was built to vehicle 3 configuration lines (139B) and the ET model approximated the vehicle 5 configurations with protuberances and attach hardware.

For these investigations the Orbiter was mounted on the primary support system and the external tank was mounted on the Captive Trajectory System. Six-component data were obtained for each vehicle at various Orbiter angles of attack and sideslip for a range of relative angular and linear displacements of the ET from the Orbiter.

INTRODUCTION

An external tank separation test, IA17A, was conducted at Mach numbers of 6 and 8. The test was conducted during the period from March 6, 1974 through March 15, 1974. Data were obtained to define the aerodynamic interference between the two bodies over a grid of five variables (α , β , x , y , z) for various initial conditions of the combined vehicles. Six component aerodynamic characteristics were obtained for both bodies. The effects of the interference on elevon effectiveness (elevator and aileron) were also investigated. All objectives of the test were met.

This report for IA17A consists of three volumes. Two volumes consist of data figures while the third has the tabulated source data. Volume one contains Figure 4 through Figure 22 of the data figures and volume two has Figure 23 through Figure 51.

NOMENCLATURE General

<u>SYMBOL</u>	<u>PLOT SYMBOL</u>	<u>DEFINITION</u>
a		speed of sound; m/sec, ft/sec
C _p	CP	pressure coefficient; $(p_1 - p_\infty)/q$
M	MACH	Mach number; V/a
P		pressure; N/m ² , psf
q	Q(NSM) Q(PSF)	dynamic pressure; $1/2\rho V^2$, N/m ² , psf
RN/L	RN/L	unit Reynolds number; per m, per ft
V		velocity; m/sec, ft/sec
α	ALPHA	angle of attack, degrees
β	BETA	angle of sideslip, degrees
ψ	PSI	angle of yaw, degrees
ϕ	PHI	angle of roll, degrees
ρ		mass density; kg/m ³ , slugs/ft ³

Reference & C.G. Definitions

A _b		base area; m ² , ft ²
b	BREF	wing span or reference span; m, ft
c.g.		center of gravity
$\frac{l}{c}$ _{REF}	LREF	reference length or wing mean aerodynamic chord; m, ft
S	SREF	wing area or reference area; m ² , ft ²
	MRP	moment reference point
	XMRP	moment reference point on X axis
	YMRP	moment reference point on Y axis
	ZMRP	moment reference point on Z axis

β_o		Orbiter angle of sideslip, deg
β_T		external tank angle of sideslip, deg
$\Delta\alpha$	DLTALF	incremental angle of attack between Orbiter and external tank, deg
$\Delta\beta$	DLTBTA	incremental angle of sideslip between Orbiter and external tank, deg
ΔX	DLT-X	horizontal distance between external tank nose mated position and instantaneous position during separation, in.
ΔY	DLT-Y	lateral distance between external tank nose mated position and instantaneous position during separation, in
ΔZ	DLT-Z	vertical distance between external tank nose mated position and instantaneous position during separation, in
δ_e	ELEVON	elevon deflection angle, deg
δ_a	AILRON	aileron deflection angle, deg
GRID	GRID	matrix of linear and angular displacements used by the Captive Trajectory System computer to position the model at the required separation distances and angles

REMARKS

During the course of test preparation and running, various events occurred having a possible effect on the test results. These items are noted below.

- 1) AEDC was unable to satisfactorily tube for ET base pressure measurement due to the lack of provisions for these measurements in the CTS.
- 2) A leak was discovered to exist in the reference pressure tubing for the transducer measuring the ET chamber pressure. This affects all ET chamber pressure data after group 110.
- 3) During the running of group 455 the Orbiter balance (-050) was damaged due to a CTS failure. All subsequent data were obtained using a similar but different balance (-048). Since no comparison runs were made between the two balances, the affect on the data cannot be determined.

CONFIGURATIONS INVESTIGATED

Model 52-0 is an 0.010-scale representation of the Space Shuttle Configuration 3 Orbiter, built to the lines depicted in Rockwell Dwg. VL70-000139B. It is of all steel construction to withstand the environment of hypersonic tunnels. Adjustable control surfaces are provided by means of interchangeable brackets.

For this test the Orbiter model was mounted on the primary support system by means of the AEDC/VKF 4.00-Y-36-050 balance and 4.06 -Z-21-047 sting. (After data group 454 the -050 balance was replaced with the -048 balance when the -050 balance was damaged). The primary support system was modified to reduce blockage, resulting in manual, rather than remote changes of angle of attack and sideslip.

The balances were water cooled. Since the flexible tubing used to carry the cooling water to the cooling jacket was larger than anticipated the aft end of the Orbiter model was milled out for clearance, including the main propulsion engines.

The 52-T model is an 0.010-scale representation of the Vehicle 5 External Tank with protrusions and attach fittings as shown on Rockwell Dwg. VL78-000062. The tank model is also of all steel construction. It was mounted on the Captive Trajectory System by means of the AEDC/VKF 4.00-Y-36-049 balance and the Rockwell built VY 109575 sting. The following configuration notation was used:

$$O_1 = B_{19} C_7 E_{23} F_5 M_4 N_8 N_{24} R_5 V_7 W_{107}$$

$$ET_1 = T_{20} AT_{16} AT_{17} AT_{18} AT_{20} PT_9 PT_{10} PT_{11} PT_{12} FL_3 FL_4$$

TEST FACILITY DESCRIPTION

The Arnold Engineering Development Center (AEDC) is an Air Force Facility located in Tullahoma, Tennessee. Tunnel B is a continuous, closed circuit, variable density wind tunnel with an axisymmetric contoured nozzle and a 50-inch diameter test section. The tunnel can be operated at a nominal Mach number of 6 or 8 at stagnation pressures from 20 to 300 and 50 to 900 psia, respectively, and at a stagnation temperature of up to 1350°R. The model may be injected into the tunnel for a test run and then retracted for model cooling or model changes without interrupting the tunnel flow.

--	--	--	--	--	--	--	--

TEST PROCEDURE

The test was conducted to obtain data for use in a separation trajectory computer program. The test program was, therefore, designed to produce data for a grid of linear and angular displacements of the ET relative to the Orbiter, for various initial conditions of the combined vehicles. In general ΔZ (vertical distance of the ET nose from its mated position) was the basic variable, a basic group consisting of a series of ΔZ values at a single value combination of the other variables.

The initial relative positions of the Orbiter and external tank were established prior to testing by physical measurements. The linear and angular movement of the ET on the CTS was controlled by the CTS computer which compensated for balance and sting deflections.

DATA REDUCTION

Data were reduced about body and stability axes systems using the following reference dimensions:

Orbiter data:

reference area	2690.0 ft. ²
reference M.A.C.	1290.3 in.
reference span	1290.3 in.
moment reference point	
X_0	= 1089.6 in.
Y_0	= 0.0 in.
Z_0	= 375.0 in.

Tank data:

reference area	2690.0 ft. ²
reference M.A.C.	1290.3 in.
reference span	1290.3 in.
moment reference point	
X_T	= 1360.1 in.
Y_T	= 0.0 in.
Z_T	= 416.4 in.

MRP locations are also shown in figures 2a and b. Orbiter-tank separation distances are as defined in figure 1b.
